

Leo and the Digital Quest

Ravi Rudra bau

Leo sits at his wooden desk, staring brightly at his glowing laptop screen as he decides to build his very own AI study buddy. He creates a dedicated folder on his computer named Week 2 Assignment and organizes his workspace for the upcoming challenge.

Opening his web browser, Leo navigates to the Google search bar and types in a request for a science PDF to understand complex topics more deeply. He downloads the chapter file directly to his computer, ready to feed it into his new digital study companion.

Leo types the web address into his browser and signs into NotebookLM using his personal Google account credentials. The sleek interface loads instantly on his screen, revealing a clean dashboard with options to create a brand new digital notebook.

With a simple click of a button, Leo uploads his downloaded chapter PDF into the newly created notebook source section. The AI tool immediately processes the document, setting the stage for an interactive learning experience.

Leo types a specific instruction into the chat box asking the AI to generate a concise one-paragraph summary of the main chapter ideas. He copies the generated response into a new document and saves it securely as the NotebookLM summary.

Curious about visual learning, Leo clicks on the mind map feature within the tool to instantly generate a web of connected concepts. He downloads the resulting image and saves it neatly into his assignment folder alongside his previous text files.

Leo tests his knowledge further by clicking on the quiz generator inside the platform to create custom practice questions. He adjusts the difficulty settings to match his grade level and copies the generated quiz into a saved document.

Leo types a creative prompt into the chat window asking the AI to explain tricky math ratios using a fun real-life analogy. The platform responds with a delightful explanation involving pizza slices, which Leo happily saves to his notes.

To wrap up his first assignment, Leo asks the AI to craft a focused thirty-minute study schedule for mastering trigonometric identities. He saves this final schedule document into his organized folder, completing the first major part of his quest.

Switching gears to his second assignment, Leo opens Adobe Express in his browser and selects the generative AI image tool. He types a vibrant descriptive prompt to generate a stunning modern poster, adds custom text to the bottom, downloads his final masterpiece, and successfully uploads the complete folder to the school portal.
